

Garmin GNS 430/530 GPS - BASIC OPERATIONS

These 4 functions should be memorized

1. **What is the operational difference between Approach LOAD and Approach ACTIVATE?** *LOAD just inserts additional waypoints into the active flight plan page. ACTIVATE changes the waypoint to the one selected when the approach was loaded.*
2. **Vectors-To-Final provides lateral course guidance to the FAF exactly like the OBS mode provides lateral course guidance to a waypoint.**
3. **OBS MODE is selected with the OBS Button.** *The CDI indicator is then rotated to select an OBS course to the waypoint. Exception: When the waypoint was loaded in conjunction with an instrument approach. In that case, the OBS course is selected with the Large and small knobs.*
4. **When LOC BC or ILS Approaches are loaded with the GPS,** *the frequency is pre-selected but not activated. The Localizer frequency must be transferred manually.*
